Tech Spot: Flywheel Replacement Kits

EXEDY Australia has developed a range of solid steel flywheels thus providing a cost effective alternative to expensive dual mass systems. EXEDY Steel Flywheels are more durable and have the advantage that they can be re-machined.

Should the flywheel not include a ring gear it will be necessary to obtain a new ring gear or re-use the ring gear from the old flywheel.

For your convenience a Tech Note is included in each kit indicating the need to re-use the original ring gear. A warning sticker is placed on the flywheel as pictured below. If the flywheel is not shrink wrapped remember to remove sticker before installing the flywheel to the vehicle.

TTK-SYK Standard Yoke Kit - to suit vehicles fitted with pull type clutch kits.

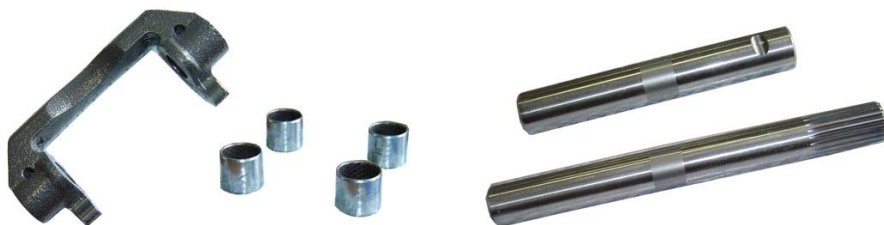

TTY-SYK includes a yoke, two cross shafts and four bushes, enabling the replacement of worn release mechanism components, which if not maintained during service, may lead to poor clutch operation and/or premature clutch failure.

We are also pleased to advise the yoke included in the TTK-SYK kit which measures 4.893" (124.3 mm) between the ears, can be used to replace the roller type yoke installed in some applications with an ear width of 4.768 (121.1 mm). This permits the use of an Exedy Australia TTK-7651 Truck Tuff Kit.

The TTK-7651 kit has been developed by Exedy Australia to suit the harsh Australian conditions and is a premium quality clutch kit which includes two seven (7) spring pre-dampened, high torque capacity clutch discs (suitable replacements for 6 and 7 spring V.C.T™ type) and a 4200 lb clamp load cover assembly, capable of transmitting up to 2250 ft/lb of torque, as used in trucks equipped with high torque power plants.

V.C.T™ is registered trademark of the Eaton Corporation
