TOYOTA LANDCRUISER FITTED WITH A SELF ADJUSTING CLUTCH COVER ASSEMBLY

We have been advised Via TMCo. That after installing a self adjusting clutch to FZJ80, FZJ100 & FZJ105 LandCruisers, the method of achieving the correct pedal height and removal of air in the release mechanism is as follows:

Whilst maintaining approximately 2500 RPM, operate the clutch pedal until the ability to select gears is achieved. Drive the vehicle a minimum of ten (10) Kms using the clutch as much as possible.

During this period, the diaphragm will have reached the designed installed height and any air will have been exhausted.
